Subject: May 2015 Monthly Report for PG&E Test Injection/Withdrawal Well 1
Permit No. R9UIC-CA5-FY13-1
King Island, San Joaquin County, California

Dear Ms. Dermer:

PG&E is providing this May 2015 Monthly Report to EPA in compliance with UIC Permit R9UIC-CA5-FY13-1, Part II.E.5 for PG&E Test Injection/Withdrawal Well 1, located within King Island Gas Field, San Joaquin County, California. The May monitoring period extends from May 1 through 31, 2015 and includes all data collected during that time period. Prior data since the start of injection is also included.

This Report provides the following minimum required information:

<u>Permit Reporting Requirements</u>	<u>Type of Information Provided</u> ¹	<u>Location of Information</u>	<u>Format of Information</u>
Part II.E.5.a and b.: Submit the following quarterly, hourly, daily, and monthly parameters: <ul style="list-style-type: none">• Injection rate, daily injection volume, total cumulative volume, wellhead injection pressure, annular pressure, and injection fluid temperature	Monitoring device data for I/W well	Attachment 1	Hard Copy and Electronic (PDF and Excel)

¹ The data provided includes hourly, daily and monthly data. Quarterly data will be presented beginning with the combined June Monthly and Second Quarter 2015 Quarterly Report, which is due to be submitted on July 28, 2015.

<u>Permit Reporting Requirements</u>	<u>Type of Information Provided</u> ¹	<u>Location of Information</u>	<u>Format of Information</u>
Part II.E.3.c.: Continuously monitored pressures and temperatures at the wellhead tubing and casing annulus of the Piacentine 1-27 observation well	Wellhead tubing and casing annulus data for Piacentine 1-27 well	Attachment 2	Hard Copy and Electronic (PDF and Excel)
Part II.E.5.e.: Submit Citizen Green 1 Well static bottomhole and wellhead pressures	Wellhead and calculated bottomhole pressure data for Citizen Green 1	Attachment 3	Hard Copy and Electronic (PDF and Excel)

In addition to the above monitoring data requirements for monthly reporting, PG&E is presenting the following information to address additional data evaluations that were performed during this reporting period:

<u>Permit Reporting Requirements</u>	<u>Type of Information Provided</u>	<u>Location of Information</u>	<u>Format of Information</u>
Part II.E.5.d.i.: Submit the following: <ul style="list-style-type: none">• Fall-off Test Results• Shut-in static reservoir pressure cumulative behavior plot of the injection zone	Fall-off Test Results, including data and reservoir pressure plots (Submitted to the EPA on June 2, 2015)	Attachment 4	Hardcopy, and Electronic (PDF and Excel)
Part II.E.5.c.: Submit periodic analyses for injection fluid characteristics	Laboratory analytical report for sample collected at completion of oxygen depleted air injection.	Attachment 5	Hardcopy, and Electronic (PDF)
Part II.E.5.c.: Submit periodic analyses for injection fluid characteristics	Laboratory analytical report for sample collected at start-up of ambient air injection	Attachment 6	Hardcopy, and Electronic (PDF)
Part II.E.5.c.: Submit periodic analyses for injection fluid characteristics	Laboratory analytical report for sample collected at completion of ambient air injection.	Attachment 7	Hardcopy, and Electronic (PDF)

A sheet that contains the abbreviations used in Attachments 1 through 3 is included as Attachment 8.

STATUS OF COMPLIANCE

A document titled *Updated Evaluation of Annular Pressure-Temperature Relationship* was submitted to the EPA on May 1, 2015. The May 1, 2015 updated evaluation supported the conclusion that observed annular pressure increases were solely a reflection of the operating conditions and not related to a loss of mechanical integrity of the tubing string or casing. The

updated evaluation also supported the conclusion of the previous evaluation, that annular pressures are expected to remain between 30 and 600 psia during normal operating conditions. It was noted that, based on the updated evaluation, a strong possibility of higher atmospheric and equipment operating temperatures as the test continues, and the high sensitivity of annular pressure to temperature, an annular pressure limit of 600 psi was considered appropriate.

From May 1 through 9, 2015, measured annular pressures in Test Injection/Withdrawal Well 1 continued to exceed the EPA specified range limit of 30 to 200 psia. PG&E notified EPA within 24 hours of the exceedances. Details regarding the exceedances were presented in a letter dated May 14, 2015. This letter also included an evaluation of the exceedances and an updated evaluation of the annular pressure-temperature relationship. The updated evaluation indicated that annular pressure is influenced by a complex set of variables. In addition, it was noted that a leak in the tubing string or packer system would result in a characteristic departure (increase) from the established cyclical pressure-temperature response that would be evident long before the previously tested casing pressure of 2,500 psig is reached. Similarly, a casing leak would result in an observed departure (pressure decrease) relative to the established relationship. It was concluded that the existing temperature and pressure monitoring program would be adequate to assure mechanical integrity during the short period of time that the well would continue to operate. Once injection ceases, the amplitude of diurnal temperature-pressure fluctuations was expected to stabilize and remain below the reporting thresholds. As part of the May 14, 2015 extended evaluation of the annular pressure-temperature relationship, PG&E requested that EPA grant an annular pressure limit of 400 psia.

The EPA responded in a letter dated May 18, 2015 and recommended setting a maximum annulus pressure of 400 psia. The EPA also stipulated that if the annulus pressure exceeds the 400 psia limit for a period greater than 24 hours, the EPA must be notified in accordance with paragraphs 2.c, 6.b, and 6.c in part II.D of the permit.

Test Injection/Withdrawal Well 1 continued to operate in full compliance with UIC Permit No. R9UIC-CA5-FY13-1 during the May reporting period.

SCHEDULE

The compression test was completed on June 4, 2015. Now that the compression test is complete, the reporting frequency will be changed from monthly to quarterly. The June 2015 Monthly Report will be combined with the Second Quarter 2015 Report, and will be submitted to EPA by July 28, 2015. Subsequent quarterly reports will be submitted to EPA by the 28th day after the end of each calendar quarter.

This submittal includes hard copies of each of the five attachments as well as a data CD with electronic copies of this report and all attachments. Electronic copies of this report and all attachments are also available at the following Dropbox link.

Notes:

- 1) Data are missing on 3/08/15 at 02:00:00 hours because this hour was lost due to daylight savings time.
- 2) Data are missing on 4/03/15 at 08:00:00 hours because the DAS data recording system was down.
No data was being recorded during this period.
- 3) Data are missing on 5/16/15 from 08:00:00 hours to 12:00:00 hours due to an accidental shutdown of the data acquisition program.
- 4) Data are missing on 5/30/15 from 05:38 hours to 06:48 hours due to site power being out. Data indicated for 05:00:00 hours and 06:00:00 are only partial due to the timing of the power outage.

Notes:

- 1) Data are missing on 3/08/15 at 02:00:00 hours because this hour was lost due to daylight savings time.
- 2) Data are missing on 4/03/15 at 08:00:00 hours because the DAS data recording system was down. No data was being recorded during this period.
- 3) Data are missing on 5/16/15 from 08:00:00 hours to 12:00:00 hours due to an accidental shutdown of the data acquisition program.
- 4) Data are missing on 5/30/15 from 05:38 hours to 06:48 hours due to site power being out. Data indicated for 05:00:00 hours and 06:00:00 are only partial due to the timing of the power outage.

Attachment 2a - Continuous Monitoring Device Data for Piacentine 1-27 - Hourly

Instrument Tag #:	PIT-016A	PIT-016B	TIT-016A	TIT-016B	
Date	Description: Time	Tubing Pressure PSIG	Annulus Pressure PSIG	Tubing Temperature °F	Annulus Temperature °F
Monthly Statistics					
February Average:	1712.8	74.9	57.9	57.7	
February Minimum:	1687.7	70.5	32.8	43.1	
February Maximum:	1744.1	82.4	90.8	76.4	
March Average:	1786.7	69.8	65.9	64.4	
March Minimum:	1736.9	68.1	37.0	46.7	
March Maximum:	1827.5	72.9	106.3	90.2	
April Average:	1842.0	74.3	66.2	65.5	
April Minimum:	1806.5	67.9	38.0	48.1	
April Maximum:	1871.0	91.3	110.1	92.9	
May Average:	1828.5	146.6	68.8	69.7	
May Minimum:	1782.2	89.5	42.9	55.7	
May Maximum:	1861.4	185.1	108.3	94.5	

Notes:

- 1) Data are missing on 3/8/15 at 02:00:00 hours because this hour was lost due to daylight savings time.
- 2) Data are missing on 3/30/15 at 14:00:00 hours because the BHP tools were installed in the well for the mid-bubblebuild pressure survey and the pressure transmitter was taken out of service.
- 3) Data are missing on 4/3/15 at 08:00:00 hours because the BHP tools were retrieved and the pressure transmitter was taken out of service.
- 4) Data are missing on 4/4/15 from 09:00:00 hours to 16:00:00 hours because the Halliburton TMDL log was run in the well and the pressure transmitter was taken out of service.
- 5) Data are missing on 4/29/15 from 08:00:00 hours to 14:00:00 hours because the Piacentine 1-27 wellhead was out of service due to conducting temperature logging in the well.
- 6) Data are missing on 5/4/15 from 09:00:00 hours to 11:00:00 hours due to the transmitter being disconnected from the pressure source (reading atmospheric pressure)
- 7) Data are missing on 5/9/15 at 10:00:00 hours due to the transmitter being disconnected from the pressure source (reading atmospheric pressure).
- 8) Data are missing on 5/16/15 from 08:00:00 hours to 12:00:00 hours due to an accidental shutdown of the data acquisition program.
- 9) Data are missing on 5/30/15 from 08:00:00 hours to 11:00:00 hours due to the transmitter being disconnected from the pressure source (reading atmospheric pressure)

May Maximum:	1936.4	193.0	2129.4

Notes:

- 1) Recorded tubing pressure and calculated bottom hole pressure data are missing beginning on 2/18/15 at 02:00:00 hours and ending on 2/20/15 at 15:00:00 hours because data were not recorded during this time due to a dead battery in the data recorder.
- 2) Recorded tubing pressure and calculated bottom hole pressure data are missing on 3/08/15 at 02:00:00 hours because this hour was lost due to daylight savings time.
- 3) Recorded tubing pressure and calculated bottom hole pressure data are missing beginning on 3/16/15 from 19:00:00 hours to 20:00:00 hours because maintenance was being performed on the recording unit (batteries were replaced).
- 4) Recorded tubing pressure and calculated bottom hole pressure data are missing beginning on 4/16/15 at 09:00:00 hours and ending on 4/20/15 at 15:00:00 hours because the recording unit was not in service due to operator error.

Subject: Submittal of Falloff Test Report
Third Compression Test Falloff Test Conducted on May 1-3, 2015
PG&E Test Injection/Withdrawal Well 1
Permit No. R9UIC-CA5-FY13-1
King Island, San Joaquin County, California

Dear Ms. Dermer:

This submittal complies with Part II.B.3.c(i,ii) of EPA Permit No. R9UIC-CA5-FY13-1 for the PG&E Test Injection/Withdrawal (I/W) Well 1. The submittal includes a report presenting the results and interpretation of the third falloff test (FOT) conducted in the I/W well on May 1-3, 2015. Per the EPA's requests in letters to PG&E dated April 6 and April 17, 2015, the FOT report includes a full discussion of FOT results and the conclusions reached based on analysis of the FOT results.

The Falloff Test Report is enclosed as one hard copy and as a PDF in a data CD. The digital data are also provided on the data CD. The documents and digital data have also been uploaded to PG&E's Dropbox account, which can be accessed at the following link:

<https://www.dropbox.com/sh/mf2qn15v016e78f/AABIm-gfjIKWPpVCKe7hUgA6a?dl=0>

If you have any questions regarding this submittal or require additional information, please feel free to contact me at (415) 973-6270.

Sincerely,

A handwritten signature in blue ink, appearing to read "M. Medeiros".

Falloff Test Report
PG&E Test Injection Withdrawal Well 1
King Island Field, San Joaquin County, CA
Test Date: May 1- 3, 2015

1. BACKGROUND

The PG&E Test Injection/Withdrawal Well 1 (I/W Well 1) is being operated as a Class V experimental compressed air energy storage (CAES) injection well. Oxygen-depleted air ('air') is being injected into a depleted natural gas reservoir in the Mokelumne River Formation (MRF) in the King Island Gas Field. The purpose of the injection is to build an 'air' bubble as part of a Compression Testing Program. During and after the bubble build period, a series of injection, shut-in, and withdrawal tests will be conducted to investigate the reservoir's performance for a CAES application. To determine and monitor formation characteristics, fall-off testing is being conducted as part of the bubble-building, equilibrium and injection/withdrawal phases of the CTP.

2. FALLOFF TEST SUMMARY

The I/W Well 1 was shut-in at 11:30:00 on May 1, 2015 to conduct a pressure falloff test for the purpose of obtaining current reservoir pressure and transmissibility data. This is the third falloff test performed after the initiation of 'air' injection on February 14, 2015 and it was conducted at the end of the bubble-building process. Prior to the start of the FOT shut-in period, a total of 483.97 million standard cubic feet (mmscf) of 'air' had been injected into I/W Well 1 (the planned bubble size is 498 mmscf). The stabilized injection rate prior to shut-in was 9.57 mmscf per day. The oxygen content of the injected 'air' is less than 5 percent.

Pressure data were recorded by a bottomhole electronic gauge with surface readout capability. The gauge is located inside the tubing at a measured depth (KB) of 4,610 feet, or 4,565 feet true vertical depth (TVD). The fall-off test ended at 11:39:26 on May 3, 2015. There are two nearby offset wells, Piacentine 1-27 and Piacentine 2-27. Both offset wells were shut-in during this FOT.

3. FALLOFF TEST ANALYSIS AND RESULTS

The falloff test pressure transient data were analyzed to obtain operational information, static reservoir pressure and the estimated formation parameters requested by EPA. The pressure transient data were input into a commercial well test software program (IHS Welltest) to make the necessary pressure graphs and diagnostic analysis.

A summary of the FOT results is given in the following table. The complete test results and analysis plots are presented in the Falloff Test Report Information section below and depicted in **EXHIBITS 1-17**.

Well Name	I/W Well 1
Test Date	01 May 2015
Test Type	Injection / Falloff
Flow Capacity (kh)	20,237 millidarcy-feet
Effective Thickness (h)	80 feet
Effective Permeability (k)	253.0 millidarcies (md)
Total Skin Factor	-1.40
p* @ Gauge Depth	2,125 psia @ 4,565' TVD
p* @ Top Completion	2,132 psia @ 4,665' TVD

The effective thickness (80 feet) for this test is estimated to be the height of the ‘air’ bubble around I/W Well 1. The bubble height is assumed to include the completion interval from 4,716 – 4,814 ft. MD (60 net feet) plus another 20 feet of the net permeable MRF formation down to the original gas-water contact (GWC) at 4,837 ft. MD (see **EXHIBIT 1**). The net permeable sand within the completion interval is 60 feet based on the petrophysical analysis of the open hole wireline logs.

The ‘air’ injection was initiated into the MRF at 13:30:00 on February 14, 2015. As of the date of the FOT, the cumulative ‘air’ injection was 483.97 mmscf. However, the last time I/W Well 1 was shut-in and the reservoir pressure nearly stabilized was on April 24, 2015 (**EXHIBIT 6, Page 4** and **EXHIBIT 7**). The actual injection time between 3-25-2015 and 4-1-2015 ($t_p = 165.7$ hours) is used in the pressure transient analysis calculations. During this 166-hour period, the average injection flow rate was 9.57 mmscf/d and a total of 66.1 mmscf of ‘air’ was injected into the well.

The log-log diagnostic plot for this FOT (**EXHIBIT 11**) exhibited a unique pressure derivative behavior (after the infinite acting radial period) which is interpreted to be characteristic of a radial discontinuity. A radial discontinuity is a change in permeability-thickness, viscosity, and/or porosity-compressibility that occurs at a given radius from a well. This behavior of the pressure derivative was also demonstrated on the two previous falloff tests.

Radial discontinuities are almost always associated with fluid injection. In this case, the injected ‘air’ bubble is distributed radially around the I/W wellbore and the air/water interface appears as a radial discontinuity. The ‘air’ zone exhibits a relative permeability to gas, gas viscosity, and gas compressibility. The water zone has a relative permeability to water (considering trapped gas), water viscosity and water compressibility. The relative permeability to gas may not equal the relative permeability to water; however, both viscosity and compressibility are significantly different for air

versus water. The result is a change in diffusivity (porosity*compressibility/h) and transmissibility (kh/μ) between the two zones which is seen in the current FOT pressure transient behavior.

To estimate the distance to the radial discontinuity or extent of the 'air' bubble, a test simulation was made with the Welltest software using the calculated diagnostic analysis results and a vertical well radial composite model. The results of the simulated test are discussed and presented in Section 6, Item 21 below, and depicted in **EXHIBITS 13-17**. A very good match of the pressure data was achieved for an effective permeability to 'air' of 253 md and an air/water interface located about 307 feet from the wellbore.

4. COMPARISON TO PREVIOUS FALLOFF TESTS

The current FOT results are compared to previous FOT results in the table below.

Comparison to Previous FOT Results						
Falloff Test Date	Final Rate	Fluid Injectate	Estimated Effective Permeability md	Effective Thickness Feet	Flow Capacity kh, md-ft	Skin Factor
10-28-2014	-15,840 bbl/day	KCL Water	140.0	31	4,340	+0.62
2-17-2015	-2.10 mmscf/d	Oxygen-Depleted Air	90.5	60	5,431	-1.45
4-1-2015	-8.52 mmscf/d	Oxygen-Depleted Air	238.1	80	19,050	-1.41
5-1-2015	-9.57 mmscf/d	Oxygen-Depleted Air	253.0	80	20,237	-1.40

The estimated permeability from the current FOT (253 md) is approximately the same as the previous FOT permeability (238 md). It was expected to be higher than the previous test because the 'air' bubble has increased in size and radial distance from the wellbore and the formation permeability is known to increase away from the well based on core data in the offset Piacentine 2-27 well. The calculated negative skin factor (-1.4) is equal to the negative skin factor determined from the previous two FOT's in February and April, 2015. The negative skin is interpreted to indicate a stimulated wellbore condition caused by the large wellbore diameter (17 inches) and the benefits of an acid stimulation treatment conducted on 11-26-2014.

5. STATIC FORMATION PRESSURE

The gauge pressure at the end of the FOT was 2,137.0 psia but this is not the static reservoir pressure because the bottomhole pressure was still falling. Using the Horner plot (**EXHIBIT 12**), an extrapolation of the pressure falloff trend was made to a

theoretical static pressure (p^*) of 2,125 psia. By comparison, the previous extrapolated p^* pressure from the 4-1-2015 FOT was 2,025 psia. The reservoir pressure has increased 100 psi since 4-1-2015 and 238 psi since the start of injection on 2-14-2015. The extrapolated p^* pressure is corrected to the top of MRF datum at 4,671' to get a current static reservoir pressure of 2,132 psia.

The table below summarizes the static formation pressure history for the MRF.

MRF Zone Static Formation Pressure History				
Test Date	Well	Cum Air Injection Mmscf	Static Pressure @ TVD psia	Comments
10-07-1985	Moresco Unit A-1	0.0	2,050 @ 4,671'	Discovery 0.439 psi/ft

5-1-2015	I/W Well 1	484.0	2,125 @ 4,565' 2,132 @ 4,671'	p^* from FOT 0.066 psi/ft correction ¹

¹ Gas gradient for oxygen-depleted air at temperature/pressure conditions (see Section 6, Item 19 below)

A graphic plot of static reservoir pressure versus cumulative injection over time as specified in Part II.B.3.c (ii) of the Permit is provided as **EXHIBIT 2**.

6. FALLOFF TEST INFORMATION REPORT

The information to be provided pursuant to Region 9 FOT Report Requirements found in Appendix E (Section 4.0) of the Permit are discussed below and presented in the referenced exhibits.

1. Company: Pacific Gas & Electric Company
77 Beale Street
San Francisco, California 94105
2. Well/Location: Test Injection/Withdrawal Well 1
King Island Gas Field, San Joaquin County, CA
Section 27, T3N, R5E, MDB&M

3. Facility Contact: Mike Medeiros
PG&E Manager Renewable Energy Development
Phone 415-973-6270
4. Openhole Log: See Platform Express log presented by **EXHIBIT 1**.
5. Well Schematic: A wellbore diagram is given by **EXHIBIT 3**.
6. Fill Depth/Date: The completion method is a gravel-packed liner.
There was no known fill in the wellbore for the test.
7. Offset Well Information: There are two offset wells, Piacentine 1-27 and Piacentine 2-27, whose bottomhole locations are 180 feet and 360 feet, respectively to the southwest of the I/W Well 1. Only the Piacentine 1-27 well is completed in the same MRF interval as the I/W well. The Piacentine 2-27 is not completed in any zone at this time. **EXHIBIT 4** shows the locations of these two wells with respect to the test well.
8. Daily Testing Activity: See event log in **EXHIBIT 5**.
9. Raw Electronic Data: The raw digital bottomhole pressure dataset is included with the **APPENDIX**.
10. Injection Rate Summary: See **EXHIBIT 6** for the injection rates preceding the FOT. A rate vs. time plot of the injection flow data is presented by **EXHIBIT 7**. The rate information is submitted electronically in the **APPENDIX**.
11. Offset Well Injection Rates: The offset well, Piacentine 1-27, was shut-in prior to and during the FOT.
12. Analyzed Falloff Data: The filtered pressure transient data analyzed in this report are listed in **EXHIBIT 8**.
13. Pressure/Temperature Gauge Information:

Bottomhole Gauge

Type: Spartek Systems Quartz SPSRO Gauge

Calibration Date: 10-16-2014

Pressure Rating – 0 to 10,000 psi

Pressure Accuracy – 0.02 percent full scale

Pressure Resolution – 0.00006 percent full scale

Drift – Less than 0.02 percent full scale/year
Temperature Accuracy – 0.25 deg C (0.45 deg F)
Temp Resolution – <0.005 deg C (<0.009 deg F)

14. General Test Information:

Test Date – May 1-3, 2015
Shut-in Time – 11:30:00 5/01/2015
Shut-in Location – Wellhead
Final Surface Pressure @ Shut-in – 1,879 psia
Final Surface Temperature @ Shut-in – 91.7 deg. F

15. Reservoir Parameters:

See **EXHIBIT 9**

Gas ('air') viscosity – 0.0225 cp
Porosity – 28 percent
Gas compressibility – $4.3597 \times 10^{-4} \text{ psi}^{-1}$
Formation compressibility – $3.1715 \times 10^{-6} \text{ psi}^{-1}$
Total compressibility – $3.0924 \times 10^{-4} \text{ psi}^{-1}$
Gas formation volume factor – $1.382 \times 10^{-3} \text{ bbl/scf}$
Extrapolated pressure (p^*) – 2,125 psia
Static formation pressure (@ 4,671') – 2,132 psia
Date formation pressure last stabilized – 4/24/2015
Justified interval thickness – 80 feet

The effective thickness is estimated to be the height of the 'air' bubble at and around I/W Well 1. An average porosity of 28 percent has been determined from petrophysical log analysis.

The reservoir (formation) compressibility of $3.171 \times 10^{-6} \text{ psi}^{-1}$ is determined from correlations based on the formation porosity of 28%. The correlation used in this analysis is applicable to sandstones and it was derived from laboratory measurements by Hall and published in the Transactions, AIME (1953) 198, p. 309.

16. Waste Plume:

Total 'air' injection is 483.97 mmSCF. The calculated volumetric radius of the air bubble, assuming a bubble height of 80 feet and an 'air' saturation of 70 percent, is:

$$r_{\text{air bubble}} = [(V_{\text{inj scf}} \cdot Bg_{\text{cuft/scf}}) / (\pi \cdot h \cdot Sg \cdot \Phi)]^{1/2}$$
$$r_{\text{air bubble}} = [(483,970,000 \cdot 0.00776) / (\pi \cdot 80 \cdot 0.7 \cdot 0.28)]^{1/2}$$
$$r_{\text{air bubble}} = 276 \text{ feet}$$

The FOT simulation (discussed in Section 6, item 21) predicts an air/water interface at a radius of 307.2 feet. The volumetric radius of 276 feet is in good agreement with the predicted radius from the FOT simulation. This was also the case for the previous FOT (4-01-2015) conducted after 245.7 mmscf of ‘air’ injection. The predicted radius from the 4-1-2015 FOT simulation was 215 feet versus a calculated volumetric radius of 202 feet. The bubble height is believed to be constrained between the top of the MRF and the original GWC based on the close agreement of the volumetric and FOT bubble radius calculations for the last two FOTs.

17. Injection Period:
Time of Injection – 24Apr - 1May2015 (165.7 hours)
Injectate – Oxygen-depleted Air
Test Pump – Compressors

18. Falloff Period:
Shut-in Time – 11:30:00 5/01/2015
End of Test Dataset – 11:39:26 5/03/2015
Total Shut-in Time – 48.2 hours
Final BH Shut-in Pressure – 2,137.0 psia
Final BH Shut-in Temperature – 122.1 deg. F
Time well went on vacuum – not applicable

19. Pressure Gradient:
The pressure gradient at the bottomhole gauge is calculated as follows:

$$\text{Gas gradient} = (0.01875 \cdot SG \cdot p) / (z \cdot T)$$
$$\text{Gas gradient} = (0.01875 \cdot 0.97 \cdot 2137) / (1.006 \cdot [460+122])$$
$$\text{Gas gradient} = 0.066 \text{ psi/ft}$$

20. Calculated Test Data:
The calculated test data for the FOT are presented by **EXHIBIT 9** and summarized below:
Slope of semi-log plot, $m = 0.4491 \times 10^6 \text{ psi}^2/\text{cp/cycle}$
Transmissibility = 898,870 md-ft/cp
Flow Capacity = 20,237 md-ft
Permeability = 253.0 md
Skin factor, $s = -1.40$

The test sequence is presented by **EXHIBIT 10**. As discussed above, the late time pressure falloff data (characterized by the increasing pressure derivative on **EXHIBIT 11**) indicate a radial discontinuity away

from the well. This is expected as the injected ‘air’ had created a large bubble around the wellbore by displacing methane and formation water. To determine the distance to the gas/water interface, a well test simulation was made using the calculated diagnostic analysis results and a radial composite model. The results of the simulated test are discussed in the *Graphs* section below.

21. Graphs:

The Cartesian, log-log, and semi-log plots are presented by **EXHIBITS 10 - 12** for the Diagnostic Analysis. The wellbore storage period (unit slope on log-log diagnostic plot) is very short for the FOT (0.01 hours) and the start of the radial flow regime (flat plateau of pressure derivative function) starts at about 0.12 hours of shut-in time. The start of the radial flow regime is identified on the ‘Typecurve’ and semi-log Horner plots in **EXHIBITS 11 and 12**, respectively. The radial flow period is used to determine the interval permeability, transmissibility and skin factor. The calculated radius of investigation for this test is 2,573 feet.

The final recorded static formation pressure at the end of the FOT dataset is 2,137.0 psia but the pressure is still decreasing. Using the Horner plot, the trend was extrapolated to a Horner false pressure, p^* , of 2,125 psia. This extrapolated pressure is used as an estimate of static reservoir pressure. By comparison, the static reservoir pressure measured just prior to the start of ‘air’ injection was 1,887 psia.

An analytical radial composite model was created (**EXHIBIT 13**) in the Welltest software program assuming a large ‘air’ bubble located radially around the wellbore (Zone 1) and a water/residual native gas region located radially beyond the ‘air’ bubble (Zone 2). Based on the core data obtained in the offsetting Piacentine 2-27 well, KH is assumed to be higher in Zone 2 than Zone 1. The Piacentine 2-27 core analysis showed average relative water permeability values of 448 to 807 md in the correlative reservoir sands.

EXHIBITS 14 – 17 present the results of the FOT Test Simulation. There is a good match between the simulated and actual pressure transient data for a radial discontinuity located 307 feet away from the I/W Well 1 and an increase in permeability-thickness. A good fit of the measured data is obtained for a permeability of 253 md in Zone 1 and a permeability of 550 md in Zone 2. This is same Zone 2 permeability as determined from the previous FOT simulation.

22. Radioactive Tracer Run: Not applicable.

DATE: 5-1-15	Time of Shift: 07:00 - 19:00	
BWES Personnel on Shift: Charles Tyler, Don Wood	Generon Personnel on Shift: Brennon, Aron, Armondo	
Summary of Events: 07:00 Plant Status: Injection Mode Units on Line: Trains - #1) LP1,NPU3,HP3, #2)LP2,NPU1,HP1, #3)LP3,NPU4,HP4, #4)LP4,NPU2,HP2, #5)LP5,NPU5,HP5 Injection Flow Totalizer- 2717 MSCF Withdrawal Flow Totalizer- 0 MSCF Yesterday Flow Total- 9459 MSCF Wellhead- 1879 PSIA Annulus- 174 PSIA 76 deg F Injection Line- 1881 PSIA 89 deg F Injection Line from compressors- 1882 PSIA 90 deg F 8.5 MMSCFD 5910 SCFM Test Separator – 0 PSIG 0% Level Down Hole Production Tubing - 2163 PSIG 115 deg F O2 Analyzers #1 4.7% #2 4.7% 07:35 Checked O2 analyzers with I/A 07:40 Drained I/A compressor of condensate 08:10 QRAE survey complete – Good – No issues 11:30 Starting shut down – Generon shutting down HP units 1-5. 11:32 All HP units down 11:33 Closed FBV- 001 11:36 All LP units down 11:37 Wing valve closed on injection well. 11:43 Plant Status – Warm up / Standby 11:47 All fin fan units and NPU units are down 11:48 O2 analyzers on I/A 11:55 Sample shack secured. Hydrocarbon analyzers secured. 12:00 Generon Crew offsite – Will be back Sunday. 18:30 Injection Flow Total- 4588 MSCF Yesterday Flow Total- 9459 MSC	Injected for (hh:mm): 4 Hrs 30 mins Withdrew for (hh:mm) 0 Hrs	
Verify all emergency equipment is functional (i.e. flashlights, etc... other?)	VERIFIED.	
Injection Flow Totalizer (DAS):	Beginning: 2717 MSCF	End: 4588 MSCF
Withdrawal Flow Totalizer (DAS):	Beginning: 0 MSCF	End: 0 MSCF
Yesterday Flow Total (DAS):	Beginning: 9459 MSCF	End: 9459 MSCF
Water Produced Totalizer	Beginning: 0 GALS.	End: 0 GALS.
I/W Annulus N2 Pressure	Beginning: 174 PSIA	End: 181 PSIA
I/W Wellhead Pressure	Beginning: 1879 PSIA	End: 1856 PSIA
Water hauled offsite (gallons):	0 GALS.	

Project #14800
PG&E CAES Temporary Site Facility
Shift Report

Description of Weather:

54 deg F Sunny 88/52 deg F

Samples Gathered: None

Issues/Equipment Malfunctions:

>Wellhead: None

>BOP: None

>ANIP: None

Dear Mark Ausburn:

Zalco Laboratories, Inc. received 1 samples on 5/26/2015 for the analyses presented in the following report.

We appreciate your business and look forward to serving you in the future. Please feel free to call our office if you have any questions regarding these test results.

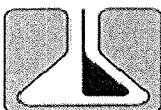

Sincerely,

Juan Magana
Project Manager

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Note: Samples analyzed for regulatory purposes should be put on ice immediately after sampling and received by the laboratory at temperatures between 0-6°C. Microbiological analysis requires samples to be at least 4-10°C when received at the laboratory. For additional information regarding the limitations of the method(s) referred to, please call us at 661-395-0539.
